### **Search Notes**

Dear Brian Yenke,

Please find attached the search results for 09/884840. I used the search strategy I emailed to you to edit, not hearing from you I proceeded. I searched the standard Dialog files, IBM TDBs, IEEE, ACM, SID, and the internet.

If you would like a re-focus please let me know.

Thank you.

Pamela Reynolds

Flat panel field emission display device, has clock generator coupled to row enable circuitry to generate clock pulse that are separated by sufficient and insufficient period to energize and fail to energize row line, respectively

Abstract (Basic):

... The device has column and row drivers coupled to respective column and row lines (711-717). The column driver drive color signals and row driver energize row lines, which are enabled and presented with row -on-time pulse. A clock generator is coupled to a row enable circuitry and generates a clock pulse which is separated by sufficient and insufficient duration to energize and fail to energize a row line, respectively.

... An INDEPENDENT CLAIM is also included for a method of displaying image information on a flat panel display screen having a matrix of pixels aligned by row line and column line...

...Used for displaying interlaced and non interlaced video information on a flat panel display apparatus...

...The method provides a row enable circuitry that is controlled by a clock generator, thereby rendering both interlaced and non interlaced display formats simultaneously in the same flat panel display device. The dual display mode can also adjust a required display format without requiring any...

Voltage signals multiplexing system for color balance adjustment in  
flat panel field emission display device

Abstract (Basic):

... Effective voltage applied during row -on time window is  
adjusted by multiplexing two different column voltages. Full and half  
column voltages are respectively applied during two parts of row -on  
time window. Length of two parts is adjusted for different colors .  
Timing circuit outputs a color select signal, based on which color  
balancing circuit outputs two different voltages.

... Rows (230) of FED screen are activated during row -on time window by drivers (220) while corresponding individual gray scale information are driven over the columns (250) by respective drivers (240). Horizontal clock signal over a horizontal clock signal supply line (214) synchronizes loading of pixel row of gray scale data in column drivers. By adjusting the effective voltage applied during row -on time window by column drivers, the intensity of particular color is controlled...

...For color balance adjustment in flat panel FED device...

...Effective column voltages are adjusted for color intensity modification, and also the color data of column drivers are not altered during color balancing, hence gray scale resolution is not degraded. Saves power by reducing frequency of voltage...

...The figure illustrates plan view of flat panel field emission display

... Horizontal clock signal supply line (214...

... Row (230...

... Column (250

Driver for matrix addressable flat panel colour display - ...  
...maintains colour separation by drive circuitry to give CRT  
compatibility

...Abstract (Basic): The flat panel liquid crystal display (100) has a  
number of individually controllable sets of red (R), green (G) and blue  
(B) pixels . The pixels are arranged in laterally extending triads  
of red, green and blue pixels such that each vertical column  
contains pixels of the same colour .  
Column ...

...Column drivers (130-140) receive and store synchronously generated red,  
green and blue control voltages for each triad of a given display panel  
row to enable application of the stored column control voltages to the  
pixels of the respective triads...

...USE/ADVANTAGE - Interfaces matrix addressable flat panel display to  
a standard CRT display controller. Does not require colour select  
circuitry. (4pp Dwg.No.2/2)

**Chromatic signal converter for flat panel display system...**

...Abstract (Basic): Video signals (1) representing **RGB** components are supplied in **synchronism** with **horizontal** and **vertical** sync signals (27) to the electro-optical polychromatic converter (3). This produces, in response to...

...ADVANTAGE - Provides viable solid-state **flat** -panel **display** alternative to CRT...

...Abstract (Equivalent): A display device for producing an image comprised of a plurality of **pixels**, said device comprising; at least a first and second light means, each light means for producing as an individual response to a video signal visible light radiations having a **colour** different from the other light means; means for mixing said **colour** radiations, light screen means for confining said mixed light, said light screen means comprised of a plurality of individually addressable light gates for permitting, when addressed, said mixed **colour** radiations to be emitted; and means for selectively addressing said light gates in a timed relationship to said video signal such that a composite multi- **colour** display is produced...

...Abstract (Equivalent): sources each producing in individual response to a video signal visible light radiations having a **colour** different from the other source means for mixing said **colour** radiations. A light screen confines mixed light, and is comprised of a number of individually addressable light gates for permitting, when addressed, the mixed **colour** radiations to be emitted. The light gates are selectively addressed in a timed relationship to the video signal such that a composite multi- **colour** display is produced. (18pp)

Colour projection video system with single light valve...

- ...uses scanning and row addressing to give simultaneous view of different light colours
- ...Abstract (Basic): a single white light source of illumination which provides simultaneous light bonds of three different colours, typically red, green and blue, using dichroic mirrors. An optical system, such as four-sided, rotating transmission prism (14) moves bonds of different colours across the surface of the light valve (20), so that portions of all the different colours are simultaneously present...
- ...Circuitry for addressing the light valve provides separate video signals corresponding to the colours, with delay and sequential serialisation to activate holes drivers in synchronism with the colour bonds being applied to the rows, one third of a frame apart...
- ...USE/ADVANTAGE - Video colour display. Projection t.v. Provides single panel colour display device to eliminate need for mechanically converging the image, reducing system cost. Optical efficiency...
- ...Abstract (Equivalent): A colour display device comprising an illumination system (10, 12, 14, 16, 18, 24, 25, 26, 28...
- ...10, 12, 14, 16, 18, 24, 25, 26, 28) provides simultaneously light beams of different colours and having a band-shaped cross-section, in that the light valve means is constituted by a single light valve (20) having a multiplicity of pixels, each of said pixels modulating light impinging thereon in accordance with an input image signal and in that said...
- ...system comprises a mechano-optical system (14) for moving said band-shaped beams of different colours across the surface of said light valve (20) so that beam portions of all different colours are simultaneously present on said light valve and an electronic light valve driving circuit (60) for addressing each band-shaped light valve portion illuminated by a colour beam so that said portion provides image information of the colour of said colour beam and modulates said colour beam with said information...
- ...Abstract (Equivalent): light valve that is to be illuminated by moving bands of first, second and third color in order to provide a full color display, said light valve including row and column drivers, said circuitry comprising...
- ...means for providing separate video signals corresponding to each of the first, second and third colors ;
- ...
- ...for providing a single serial stream of signals corresponding to said first, second and third colors in sequential order...
- ...means for applying said serialized stream to the column drivers of said light valve; and...
- ...means for activating said row drivers, said row drivers being activated in non-sequential order to correspond with the color bands being applied to the row .
- ...

...A colour display system comprising...

...a) a light valve having an array of rows of addressable **pixels** for modulating light impinging on the light valve in accordance with display signals applied to the **pixels** ;

(...

...b) means for providing at least two light beams, each beam having a different **colour** , and each beam being wider in the direction of the width of the **pixel** rows to be addressed and narrower in the direction of the height of the **pixel** rows to be addressed...

...in the height direction in a manner that each of the at least two different **colour** beams illuminates only a portion of the **pixel** rows to be addressed at any one time, whereby each addressable **pixel** row of the light valve is repeatedly impinged by the at least two different **colour** beams in sequence; and...

...d) means for repeatedly addressing the rows of **pixels** of the light valve in sequence with display signals corresponding to the **colour** of the beam to impinge on the **pixels** being addressed, so as to form a **colour** display image

...SPECIFICATION polarizing device 42 is provided, which polarizes the light emanating from the pixels 21. On **top** of this polarizing device 42 rows of polarizing prisms 43 are provided, so that the **bottom** of each **prism** 43 covers one **row** of pixels 21. These polarizing prisms 43 form a polarizing **prism** sheet 44. The polarizing device 44 is controlled by a controller 45, whereas the display...

...SPECIFICATION a so-called mixed strip image, wherein pixels for the left and right image form **vertical** rows, respectively. As it is clear from the depicted rays of the respective pixels, right...

...their way to the left eye, wherein left image pixels 2 are blocked for the **right** eye. Further **it is clear** from Fig. 5, that using a parallax barrier 4 with a fixed pitch between the barrier strips results in a fixed **viewing** distance for the left and right eye LE, RE.

Figure 1 shows a stereoscopic display **system** using polarized light for creating the **stereoscopic** effect. On top of a flat panel display 1 consisting of pixels 21 a polarizing defice 42 is provided, which

polarizes the light emanating from the pixels 21. On top of this polarizing device 42 rows of polarizing prisms 43 are provided, so that the bottom of each prism 43 covers one row of pixels 21. These polarizing prisms 43 form a polarizing prism sheet 44. The polarizing device 44 is controlled by a controller 45, whereas the display 1 is controlled by a display controller 46. Both controllers...

...of rows of prisms 43 rests. In Figure 2 the left eye LE sees only the right side surface 48 of the polarizing prisms 43, whereas the right eye RE only sees the left side surface 49 of the polarizing prism. When the polarization direction of the...

...the right side surface 48 of the polarizing prism 43, the flat panel display displays left eye image. During this time the rays of the flat panel display 1 are not...

...the left side surface 49 of the polarizing prism 43, because the polarization direction of the polarizing device 42 is perpendicular to the polarization direction of the left side surface of the polarizing prism 43. After a moment the polarization direction of the polarizing device 42 is changed to the other direction and it is parallel to polarizing direction of the left side surface 49 of...

...SPECIFICATION 2 and 3 for the left and right image, which are arranged alternately in a **row**, so that a **column** consists of pixels for the left and right image, respectively, only. With this arrangement a so-called mixed stripe image is formed wherein the **columns** for left and right image alternate. A first lenticular lens sheet 4 is provided in front of the **flat panel display 1** to generate the stereoscopic effect. This first lenticular lens sheet 4 is followed by a **prism** array sheet 5 consisting of **prism** arrays oriented along the pixel **columns**. These **prism** arrays deflect the main lobe of the emanating light of the pixels to the viewing...

...in respect to the relative position of the pixel arrays to the middle of the **flat panel display 1**. Therefore in the middle of the **flat panel display 1** the prisms are degraded to a flat plate. On **top** of the **prism** array sheet 5 second lenticular lens sheet 6 is provided wherein the angle of the lens stripe vary as a function of the relative position to the middle of the **flat panel display 1**.

Fig. 2 shows a cross section of the stereoscopic display according to Fig. 1...

...SPECIFICATION 1 shows a perspective view of a stereoscopic display according to the invention with a **flat panel display 1** which incorporates the pixel plane consisting of pixels 2 and 3 for the left and right image, which are arranged alternately in a **row**, so that a **column** consists of pixels for the left and right image, respectively, only. With this arrangement a so-called mixed stripe image is formed wherein the **columns** for left and right image alternate. A first lenticular lens sheet 4 is provided in front of the **flat panel display 1** to generate the stereoscopic effect. This first lenticular lens sheet 4 is followed by a **prism** array sheet 5 consisting of **prism** arrays oriented along the pixel **columns**. ...CLAIMS scene.

5. A device for displaying a plurality of scenes in sequence, comprising:

a first **horizontally** disposed plate member having a **row** of equally spaced apart openings, and one end of a light transmissible tube releasably inserted...

...correspondingly spaced apart, have their axes in parallelism and all axes lie in the same **vertical** plane

an elongated light source in each light transmissible tube,  
a plurality of display units, each **display** unit comprising three **thin** transparency panels constituting a triangular **prism** having opposite open ends, a pair of adapter elements each having three corresponding sides arranged in triangular configuration for fitting into said opposite open ends of the triangular **prism**, the adapter elements having an opening to provide for the display units to rotate about...

...maintaining said corresponding transparency panels that represent portions of the same scene in each triangular **prism** in fixed rotational angular relationship such that when panels of the triangular prisms representing portions...

...scene are rotated to contiguous coplanar relationship said scene is composed for visualization,

a second **horizontally** disposed plate member having openings for fitting, respectively, onto the other ends of said light...

Claims

#### Claim

... N) of turns to be made by  
the motor 26, the tooling factor (ratio of **vertical** film  
growth rate to measured deposition rate), an initial  
deposition rate estimate, an initial angle...azimuthal rotation rate of  
the  
<@substrate is plotted against time for the case when the  
**column** forms a sinusoidally varying structure as  
illustrated in Fig. 7C. Times corresponding to points T1...

...periods of rotation,  
illustrated by the time segments 52, spinning growth  
occurs, resulting in the **vertical column** segments 58 shown  
in Fig. 7C. The width of the time segments 52 corresponds  
to...

...the substrate  
continues to be exposed to vapor flux (paused growth),  
resulting in the slanted **column** segments 59. The period  
SUBSTITUTE SHEET (RULE 26)  
between the time segments 52 continually decreases...

...rotation and the pause position  
switches from the one side to another such that the **column**  
begins to grow in a different direction. The half-rotation  
at T3 corresponds to altering...

...as illustrated by the arrows C and D in Fig. 7C. In this  
manner, the **column** angle  $\theta$  varies with distance (measured  
perpendicularly) from the substrate. **Column** segments  
deposited at the same time across a substrate form a layer  
of a thin...a rotation of about  $360^\circ$   
no, which results in an offset growth direction for the  
**columns** of thin films at an angle that is determined by the  
azimuthal angle of...

...slower rotation (centered about times T2) for another half  
a rotation are illustrated. The corresponding **columnar**  
growth is shown in Fig. 7E, showing the positions on the  
**column** 90 corresponding to the times T1 and T2.  
It is believed on reasonable grounds that the  
process will work with any **column** forming depositable  
material. Depositable material is **column** forming when it  
exhibits limited adatom diffusion and a sufficiently high  
sticking factor that structures...

...the case of MgF2 thin film formed on a  
is silicon substrate, with S shaped **columns** , the substrate  
need not be heated, but the substrate temperature will rise  
to about 1000C...

...26)  
during deposition. The axial rotation is rapid during the  
deposition (spinning growth), generating a **vertical** porous  
**columnar** structure and eliminating the helical **columnar**  
structure produced by conventional application of ...to the  
distance from the substrate, as illustrated in Fig. 13. In  
Fig. 13, the **columns** 80 are grown from a substrate 10 with  
rapid spinning throughout. As the polar angle  $\theta$  is varied,  
the **columns** 80 produce layers of greater density as shown  
at 82 and lower density as shown...

...of air was found to predict  
accurately the effective refractive index as measured with  
a **prism** coupler.  
As an example, a film with a sinusoidal variation  
-of refractive index, the tilt...

...51o and 81o during deposition. The  
axial rotation is rapid during the deposition, generating  
a **vertical** porous **columnar** structure and eliminating the  
helical **columnar** structure produced for other applications  
of GLAD. This deposition process has been used to produce...illustrated  
in Fig. 12. Vapor  
deposited material extends in distinct (separate from one  
another) helical **columns** 70 from an electrode 72 lying on  
substrate 10. Electrode 72 may also be located on the other  
SUBSTITUTE SHEET (RULE 26)  
side of substrate 10. The distinct helical **columns** 70  
terminating distally from the substrate 10 in a region of  
denser material forming a cap 74 for the helical **columns** .  
The cap 74 may be produced by changing the angle of  
incidence of the flux...

...substrate surface), or, it is believed on reasonable  
grounds that, the deposition of the helical **columns** may be  
ended under conditions giving rise to a higher diffusion  
length, as for example...

...be required to create  
conditions of high diffusion length.  
As shown in Fig. 12, plural **top** electrodes 77 may  
extend in parallel strips across the **top** of the cap layer  
74 or a single electrode may be formed as a single plate on  
the **top** of the cap, or the cap may be formed of  
electrically conducting material to act...

...catalyst  
supports, thermal barrier coatings on high temperature  
cycling parts such as jet turbine blades, **flat** panel  
**displays** , thermoelectric cooling panels, solar absorbers,  
adhesive surfaces, electron emitters, tactile sensing for  
SUBSTITUTE SHEET (RULE...

Detailed Description

Detailed Description

FLEXIBLE **FLAT** COLOR **DISPLAY**

Field of the Invention

The present invention generally relates to electronic, lightemitting displays.

Background of...

L'image stabilisee sans le numerique  
WORLD - NEW PALMCORDER AND HDTV DEVELOPMENTS  
Audiovideo Magazine (AVM) 0 July 1992 p39

Sony and Canon have developed a new image stabilising technique, known as  
Active **Prism** , to compensate for the fact that a user's hand tends to  
tremble when using a palmcorder. The Active **Prism** system, details of  
which are included in the article, is based on a device that automatically  
controls the angle of an active **prism** placed in the lens of the  
palmcorder. This **prism** is linked to a sensor that detects and estimates  
vibrations. Unlike the digital image stabilisers used in palmcorders from  
Panasonic and Mitsubishi, the Active **Prism** system is said to maintain  
excellent **vertical** and **horizontal** resolution. The CCD TR900, part of  
the Handycam TR range, is the first camcorder to use the Active **Prism**  
system. An Hi8 model, the CCD TR900 includes a 1/3-in format, 410k **pixel**  
CCD, a x 10 zoom and a stereo microphone. Meanwhile Hughes Aircraft and JVC  
have...

DOCUMENT TYPE: Evaluation ISSN: 0963-5750 LANGUAGE: ENGLISH

RECORD TYPE: FULLTEXT; ABSTRACT

WORD COUNT: 432 LINE COUNT: 00032

...ABSTRACT: SVGA monitor from Aydin Controls has a reasonably good image though it lacks brightness and **colors** are lighter and weaker than on a Trinitron tube. Features include resolutions from VGA to non-interlaced 1280-by-1280 **pixels**, automatic **synchronization**, reasonably **flat screen** and .31mm dot pitch. Controls include the usual brightness and contrast adjustments, **horizontal** and **vertical** size and position controls, vertical 'side pincushion' distortion and horizontal skewing. Drawbacks include slight coarseness...

TEXT:

Colour ferroelectric liquid crystal display ( FLCD ) technology  
developed in UK by Thorn EMI is likely to be licensed to Japanese  
manufacturers in the near future (see also 1992/77b2 and "Prototype display  
may herald HDTV screens" under Technical Developments). Current FLCD  
displays produced by manufacturers such as Thorn EMI (Central Research  
Laboratories, Dawley Road, Hayes, Middlesex UB3 1HH, England;  
+44/81/848-9779) are mainly used in lap-top computers. However, large  
screens made up of smaller FLCD panels may be key to light-weight HDTV  
systems for the home.
